

CICS/Swap

Run up to 8 logical sessions on a single CICS terminal

- Up to 8 sessions for each CICS terminal
- End users can override swap keys
- Automatically handles applications that have temp storage ids with termid as part of the name
- Supports applications with different screen sizes
- Runs on all current CICS releases
- Maintains integrity by preventing another user from inheriting screens on the same terminal

CICS/SWAP is a facility allowing a single CICS terminal to function as up to eight logical terminals with each one running the same or different transaction. Each terminal or user can have a unique maximum session value. Navigation between the sessions is accomplished by pressing the designated SWAP (PF/PA) key to rotate forward or backward one session at a time. From the Selection Screen you can also hide low-priority sessions to make navigation between hot sessions easier or you can close unused sessions.

SWPMSEL MacKinney Systems CICS/SWAP Ver 4.4 Selection Screen							TERMID: T05A
Enter S-select, C-close, F-force close, H-hide, U-unhide session							MAXSES: 8

5		ACTIVE		ST2A	000		
6		INACTIVE		000		
7		ACTIVE		EML	000		
8	*CURRENT	INACTIVE			000		

ENTER=Process PF1=Help PF3=Return PF5>NewSession

You can press the select (PF/PA) key or type in the “SWAP” transaction to bring up the Selection Screen, from where you can directly select a session or open a new session. This screen shows eight sessions with default forward (PF12), backward (PF11) and select (PF9) keys. The SPYA transaction in session 1 has override PFKeys for forward (PF5) and backward (PF4). Overrides for transactions are defined in the SWAP table by the administrator.

User Flexibility

Users can open up a specific number of sessions and override the default PF/PA keys by issuing the SWAP ON command with specific override parameters as shown here. A user can also request SWAP keys be ignored for a time by issuing the SWAP OFF command.

```
swap on,ses=3,fwd=pf12,bwd=pf11,sel=pf9
```

```
SWPE010-SWAP ENABLED FOR T05A WITH SES=3, FWD=PF12, BWD=PF11, SEL=PF9
```

In these samples, the user is requesting 3 sessions be started with a FWD key of PF12, a BWD key of PF11 and a SEL key of PF9.

Administration

Administration of CICS/SWAP is accomplished by a combination of a simple table and online screens. In the table you define how many terminal entries to allow for, plus you define any default and special overrides (by terminal, user and transaction). You can prevent a user from swapping or require using different SWAPkeys when a certain transaction is active for example.

The online administration screen allows you to customize CICS/SWAP for your environment. A user exit is available that receives control when a new session is opened. You can customize the exit to automatically start specific transactions for certain sessions, pop up a menu, or write out a message for the user.

CICS/Swap runs on all CICS releases under VSE or MVS. Download a free trial from www.mackinney.com or call for more information.

MacKinney Systems also markets a VTAM session manager (VTAM/SWITCH) which allows switching from CICS to TSO, etc. Please call for more information.
